1. PROJECT DESCRIPTION

Madhu Silica Pvt. Ltd. (MSPL), Bhavnagar, is the largest manufacturer of precipitated Silica in India and it is the 3rd largest company in the world. MSPL with its allied company Aqua gel Chemicals Pvt. Ltd., is having seven established plants capable of manufacturing around 95000 MT of precipitated Silica per annum. It has recently established a state of art plant with capacity of 45000 MT/Annum in Bhavnagar. The company has a large business associate network in India and Asia, Middle East, Latin America, US & Europe. Apart from the large Indian market, the company exports their products to more than 40 countries. The company has on its credit ISO 9001:2008, ISO 14001:2004, OHSAS 18001:2007, FAMI-QS, FDA certified and registered for each.

MSPL has planned for capacity expansion in 28 acres of land towards total installed capacity of precipitate Silica of 95000 MT/Annum. Under this development process, MSPL has obtained permission to discharge additional 10 MLD (417 m³/hour) treated industrial effluent in the marine environment. It has laid a submarine pipeline with diffuser on the creek bed for discharging the effluent.

MSPL obtained MoEFCC clearance vide F. No. 11-6/2015-IA-III dt. 29.06.2015. The post project monitoring is being carried out for four seasons in a year to comply the conditions of MoEFCC covering the aspects of seawater quality, seabed sediment quality and marine benthic flora & fauna. The monitoring studies are being carried out from May 2017 i.e. since the commencement of project on quarterly basis. The periodic monitoring reports are being regularly submitted to the Regional Office of MoEFCC, Bhopal. This report forms as the third periodic monitoring (November 2021) for the year 2021 - 2022.

Due to COVID-19 Nationwide lockdown and strict interstate travel protocols, quarterly monitoring study for the 1st season period March 2021 – May 2021 was not conducted. However, after the interstate relaxations, 2nd season quarterly monitoring study for June 2021 to August 2021 was conducted and report has been submitted. This forms as the 3rd season Quarterly Monitoring Report (September to November 2021) for the year 2021-22.

The location map is shown in Fig. 1 and the effluent outfall location is shown in Fig. 2.

2. SCOPE OF MONITORING

Periodic monitoring near the outfall location as suggested in the Post Project Monitoring Plan of the EIA report was recommended by the MoEFCC. Accordingly, MSPL has asked Indomer Coastal Hydraulics (P) Ltd, Chennai, to take up periodic monitoring programme. It was proposed to conduct quarterly monitoring covering four times in a year i.e., in the months of May, August, November and February every year during the project operational period.

Indomer Coastal Hydraulics (P) Ltd., Chennai is an ISO 9001:2015 organization, NABL and QCI - NABET accredited organization vide NABET/EIA/2023/RA 0207 dt. 29.06.2021 for <u>Sector 27</u>: Oil & Gas Transportation pipeline (crude and refinery/petrochemical products), passing through national parks/ sanctuaries/ coral reefs/ ecologically sensitive areas including LNG Terminal and <u>Sector 33</u>: Ports, harbours, jetties, marine terminals, breakwaters and dredging.

QCI-NABET accreditation certificate is attached as Annexure I.

3. DATA COLLECTION FOR MONITORING

The creek water, creek bed sediments and biological samples were collected at three locations around the outfall points (SS1 to SS3) in November 2021. The samples for intertidal benthos were also collected at three locations (IB1 to IB3). The details of the sampling locations are given in Table 1 and shown in Fig. 2. The monitoring work covered is listed below:

i) Creek water quality parameters at three locations at surface and bottom:

Temperature

рΗ

Salinity

Dissolved Oxygen (DO)

Total Dissolved Solids (TDS)

Biochemical Oxygen Demand (BOD)

Chemical Oxygen Demand (COD)

Ammonium

Nitrite

Nitrate

Total nitrogen

Phosphate

Total phosphorus

Turbidity

Total Suspended Solids (TSS)

Cadmium

Lead

Mercury

Total Chromium

Phenols and

Total Petroleum Hydrocarbons

ii) Creek bed sediment quality parameters at three locations:

Sediment Texture

Total Nitrogen

Total Phosphorous

Total organic carbon

Calcium carbonate

Cadmium

Lead

Mercury

Total Chromium

Phenols and

Total Petroleum Hydrocarbons

iii) Biological parameters at three locations on:

Primary Productivity
Phytoplankton, its biomass and diversity
Zooplankton, its biomass and diversity
Sub-tidal and inter-tidal macrobenthos, its biomass and diversity and
Microbial population in creek water and sediment

Analysis: All the water and sediment parameters were analyzed by Indomer Coastal Hydraulics Pvt. Ltd., which is accredited by the National Accreditation Board for Testing and Calibration Laboratories (NABL) vide certificate no. TC-5232/12.01.2022. Analysis of Total Petroleum Hydrocarbons in creek water and sediment samples was outsourced to NABL accredited Laboratory. NABL accreditation certificate of Indomer is attached as Annexure II.

<u>Sample Analysis Protocol</u>: Creek water and creek bed sediment samples were analyzed as per the IS/APHA/USEPA standard methods, details of which are given below.

| Sl.No. | Parameters | Protocol |
|---------|------------------------|---------------------|
| Water o | uality | |
| 1 | Temperature | IS 3025 : Part 9 |
| 2 | рН | IS 2720 : Part 11 |
| 3 | Salinity | IND/SOP/WQ/13 |
| 4 | Dissolved Oxygen | IS 3025 : Part 38 |
| 5 | Total Dissolved Solids | IS 3025 : Part 16 |
| 6 | BOD | IS 3025 : Part 44 |
| 7 | COD | IS 3025 : Part 58 |

| 2 | Total Organic Carbon | IS 2720 : Part 22 |
| 3 | Total Nitrogen | IS 14684 – 1999 |
| 4 | Total Phosphorous | IS 10158 – 1982 |
| 5 | Calcium carbonate | IS 2720 : Part 23 |
| 6 | Cadmium | USEPA 3050 B |
| 7 | Lead | USEPA 3050 B |
| 8 | Chromium | USEPA 3050 B |
| 9 | Mercury | USEPA 3050 B |
| 10 | Phenols | USEPA 8041 & 3545 A |
| 11 | Petroleum Hydrocarbons | TNRCC method 1055 |

Biological parameters

Primary Productivity: Primary production will be estimated from appropriate study area sampling stations. From the water sampler, the samples must be immediately transferred to 125 ml DO bottles (two light bottles and one dark bottle). The sample in the first bottle will be used immediately to determine the initial level of dissolved oxygen (DO) content followed by Winkler method. The light and dark bottles will be incubated under water for a period of 6 hr and dissolved oxygen will be measured. Primary productivity was calculated by oxygen method. Oxygen values swill be converted to carbon values by applying the equation.

Phytoplankton: Phytoplankton samples will be collected from appropriate study area sampling stations, for both qualitative and quantitative analyses.

Phytoplankton samples for quantitative analyses will be taken by 1 liter plastic container from surface water and preserved with Lugol's iodine solution. The analysis of phytoplankton samples include initial concentration of water sample to 15 ml volume based on settling and siphoning procedure. Quantitative estimation of phytoplankton will be done by counting in Sedge wick-Rafter cell counter. It involved

calculation of the number of cells of each species of phytoplankton in one liter of water sample.

For the qualitative analysis, phytoplankton samples will be collected using circular standard plankton net (60µ mesh and 60 cm mouth diameter). The net will be towed at subsurface for 5 minutes. After the collection, samples must be preserved in 4% buffered formaldehyde and analyzed under an inverted microscope following the standard literature (R. Subrahmanyan, 1946; C.P. Gopinathan, 1976 and Thomas, 1997).

Zooplankton: Zooplankton samples will be collected using circular zooplankton net (300 μ mesh and 60 cm mouth diameter). The samples must be collected during day time to calculate their biomass, population and bio diversity. The net will be towed for 5 minutes. After the collection, samples must be preserved in 5% buffered formaldehyde. The biomass value of zooplankton will be calculated using the displacement volume method. The faunal composition and the relative abundance of different zooplankton taxa will be sorted out and identified from aliquots upto species level as far as possible. All taxonomic observation and measurements will be made on preserved samples. Specimens will be identified based on the standard manuals (Kasturirangan, 1963; and Conway et al. 2003). The estimated abundance (density) for the different groups will be expressed as nos. /100m³.

Flowmeter: Digital Flowmeter (model - 2030R) duly calibrated by the company will be used for estimating the volume of flow into the net towed for 5 minutes for the collection of phytoplankton and zooplankton. The flow meter consists of an impeller and a counter. The impeller is directly connected to the counter which records each revolution of the impeller. The flow meter has to be attached to the mouth region of the plankton net.

Macro Benthos: Seabed sediment samples will be collected using Van Veen grab from sampling stations. The intertidal benthic samples will be collected from appropriate stations. The benthic organisms will be separated by sieving through 500 micron mesh and preserved using formaldehyde and Rose Bengal stain. The samples will be sorted and identified upto

groups/genera level using stereo microscope. The wet weight will be taken to calculate the biomass of benthic organisms.

Microbiology: The microbiological samples will be collected from appropriate study area sampling stations. The total coliform from each location will be identified by membrane filter technique (APHA 9060 A & B). Samples will be collected clean, sterile and non-reactive glass or plastic bottles. Microbial analysis is started as soon as possible after collection to avoid unpredictable changes. Spread plate method will be used to culture the microorganisms. The agar media used for analysis were: Nutrient agar, MacConkey agar, Thiosulphate Citrate Bile Sucrose agar, Xylose Lysine Deoxycholate agar, M-Enterococcus agar and Cetrimide agar. Plates were incubated at 37° C for 48 hrs. After incubation, the colonies will be counted and identified based on their colour characteristics.

4. RESULTS

4.1. Water quality

The estimated creek water quality parameters on temperature, pH, salinity, total dissolved solids, dissolved oxygen, ammoniacal-nitrogen, nitrite-nitrogen, nitrate-nitrogen, total nitrogen, phosphate-phosphorus, total phosphorus, total suspended solids, and turbidity are presented in Table 2. Biochemical Oxygen Demand and Chemical Oxygen Demand are presented in Table 3. Results of the heavy metals cadmium, lead, total chromium, mercury, phenols and total petroleum hydrocarbons are presented in Table 4.

During the present study, creek water salinity ranged from 19.1 to 20.1 PSU and pH range was 7.34 to 7.49. The values of salinity and pH are very low compared to previous study, which may be due to freshwater influx and effect of monsoon rain runoff in the creek water. Very high amount of fresh water flow was observed in the creek during the sample collection. Hence, salinity and pH values were low in the creek water.

The range of TSS (1520 to 1786 mg/l) was found to be high compared to the previous sampling period of august 2021. Dissolved oxygen values ranged from 5.8 to 6.1 mg/l, which is a small fluctuation, to the earlier reported values. BOD values were also found to be normal (<2 mg/l) like earlier periods at all the three stations.

Ammoniacal-Nitogen, Nitrite, Nitrate, Total Nitrogen, Phosphate and Total Phosphorus concentration levels show seasonal variation and however all the nutrients values are observed to be within the normal range. Cadmium levels ranged from 1.95 to 2.01 μ g/l and Chromium concentration ranged from 2.08 to 2.26 μ g/l. However, the metals were observed to be in trace level in the study areas. Similarly, phenols and total petroleum hydrocarbons were also found to be below detectable levels during the present study.

Creek water values for Turbidity, TSS, DO, BOD, nutrients, heavy metals and other organic compounds were found to be in normal range. Hence, it can be confirmed that treated effluent is discharged into the creek environment do not affect the creek water quality.

4.2. Sediment quality

The creek bed sediment quality parameters collected at 3 locations (SB1, SB2 and SB3) are given in Tables 5 and 6. Results of cadmium, lead, total chromium, mercury, phenols and total petroleum hydrocarbons in sediments are presented in Table 7. Sediment texture, find sand nature was found during the present study period, at all stations. Total phosphorus, calcium carbonate, total nitrogen and total organic carbon values at all stations, varied slightly, compared to pre-project period study. Total nitrogen values ranged from 26.8 to 42.6 mg/kg at the three stations. Cadmium, mercury, lead, phenols and total petroleum hydrocarbon levels were found to be below detectable limit, at all the three stations. However, marginal difference was observed in the chromium level, between the pre-project period and the present study (23.2 to 24.6 mg/kg).

During present study, sediment nature was found to be find sand texture. The levels of trace metals mercury and lead at all three stations along with phenols and petroleum hydrocarbons in the sediment were found to be below detectable level. Chromium values ranged from 23.2 to 24.6 mg/kg at all three stations. In general, these conditions reflect that the creek bed sediments are in normal condition and remain uncontaminated.

4.3. Biological parameters

Phytoplankton and primary productivity: Phytoplankton are the primary source of food in the marine environment. The concentration and numerical abundance of the phytoplankton indicate the fertility of a region. The phytoplankton population depends primarily upon the nutrients present in the creek water and the sunlight for photosynthesis. This primary production is an important source of food, for the higher organisms, in the marine environment. The measured primary production results indicate that the area is moderately productive, and the values varied between 330 and 420 mgC/m³/day; the recorded average value is 370 mgC/m³/day (Table 8).

Various phytoplankton groups were observed, and their percentage composition and numerical abundance are shown in Table of 9 and 10. Phytoplankton diversity fluctuated from 21 to 29 species. Bacillariophyceae (diatoms) formed the major group followed by Dinophyceae (dinoflagellates) and Cyanophyceae (blue green algae). Phytoplankton population density varied from 2400 to 2750 cells/l (Table 11).

Phytoplankton population were found three classes namely, Bacillariophyceae (75.6%), Dinophyceae (15.4%) and Cyanophyceae (9.0 %) (Table 10). During the study period, Coscinodiscus centralis was the most dominant species in the study area followed by Odontella mobiliensis, Ceratium sp. Bacillaria paradoxa and Triceratium sp.

Zooplankton: The numerical abundance of zooplankton varied from 8275 to 10594 nos./100m³ (Table 12). The highest zooplankton population was observed at SS2 and the lowest was observed at SS3. The zooplankton biomass varied from 10.7 to 13 ml/100m³ (Table 13). It is observed in seasonal variation. The most dominant zooplankton species are *Oithona nana*, *Brachionus plicatilis*, Copepod nauplii and *Nannocalanus* minor among the total of 29071 species.

Benthos: Benthic faunal population in an environment depends on the nature of the substratum and the organic matter content of the substratum.

<u>Sub-tidal benthos</u>: The numerical abundance of the benthic fauna varied from 180 to 520 nos./m² (Table 14).

<u>Inter-tidal benthos</u>: The existence of fauna appeared to be moderate in the three (IB1 to IB3) locations. The numerical abundance of the intertidal benthic fauna varied between 180 and 240 nos./m² and the intertidal faunal population is shown in Table 14.

Microbiology:

Bacterial counts in the water and sediment samples were analyzed and presented in Tables 15 and 16 respectively. In the water samples, population density ranged from 0.01 to 5.18×10³ CFU/ml. In the sediment, the population density ranged from 0.02 to 5.23×10⁴ CFU/g. Bacterial population was found normal. In general, there is not much of a variation observed between the present and earlier values both in creek water and sediment.

Primary production, phytoplankton and zooplankton are found to be in normal values. The sub-tidal and inter-tidal benthic population showed normal range at all three stations during the study. Bacterial population in water and sediments also indicated normal range.

5. ENVIRONMENTAL STATUS - COMPARISON WITH PRE-PROJECT PERIOD

Comparison of water quality, sediment quality and biological parameter results were carried out between the pre-project period (May 2013) and the periodic monitoring results of November 2021 as given in Tables 17, 18 and 19.

Water Quality

It is inferred that the water quality parameters showed normal range as applicable for the creek waters in Bhavnagar and they are comparable with the pre-project period results. The differences are very marginal, and they are due to seasonal variation which is common for creek waters.

Sediment quality

Sediment texture was predominantly towards fine sand in nature during present study and other chemical properties are observed to be in normal range and there is no significant change in the creek bed sediment quality.

Biological Parameters

Primary production, Phytoplankton and Zooplankton population were showing marginal seasonal variation but it notified within the normal range in the present observation. Also found the attribute range meets the optimum water quality conditions. The sub-tidal and intertidal benthic population showed normal range compare than previous monitoring period of November 2021.

Microbiology

There are no changes observed in bacterial population, in water and sediments, among the different sampling periods in this creek.

Collection of sediment sample

Collection of plankton sample

Collection of Intertidal benthos sample

Quality Council of India

National Accreditation Board for Education & Training

CERTIFICATE OF ACCREDITATION

Indomer Coastal Hydraulics (P) Ltd.

63, Gandhi road, Alwarthirunagar, Chennai 600087

The organization is accredited as Category-A under the QCI-NABET Scheme for Accreditation of EIA Consultant Organization, Version 3: for preparing EIA-EMP reports in the following Sectors –

| SI. No. | Sector Description | Sector (as per) | | |
|------------|--|-----------------|--------|------|
| | | NABET | MoEFCC | Cat. |
| 1. | Oil & gas transportation pipeline (crude and refinery/ petrochemical products), passing through national parks/ sanctuaries/coral reefs / ecologically sensitive areas including LNG terminal | 27 | 6 (a) | A |
| 2. | Ports, harbours, break waters and dredging | 33 | 7 (e) | A |

Note: Names of approved EIA Coordinators and Functional Area Experts are mentioned in RAAC and Supplementary MoM dated Jan 27, 2021, and June 08, 2021 respectively posted on QCI-NABET website.

The Accreditation shall remain in force subject to continued compliance to the terms and conditions mentioned in QCI-NABET's letter of accreditation bearing no. QCI/NABET/ENV/ACO/21/1784 dated June 29, 2021. The accreditation needs to be renewed before the expiry Indomer Coastal Hydraulics (P) Ltd. following due process of assessment.

Sr. Director, NABET

Dated: June 29, 2021

Certificate No. NABET/EIA/2023/RA 0207 Valid till Sept 13, 2023

For the updated List of Accredited EIA Consultant Organizations with approved Sectors please refer to QCI-NABET website.

National Accreditation Board for Testing and Calibration Laboratories

CERTIFICATE OF ACCREDITATION

INDOMER COASTAL HYDRAULICS PRIVATE LIMITED

has been assessed and accredited in accordance with the standard

ISO/IEC 17025:2017

"General Requirements for the Competence of Testing & Calibration Laboratories"

for its facilities at

NO 63, GANDHI ROAD, ALWAR THIRUNAGAR, CHENNAI, TAMIL NADU, INDIA

in the field of

TESTING

Certificate Number:

TC-5232

Issue Date:

13/01/2019

Valid Until:

12/01/2021*

* The validity is extended for one year up to 12.01.2022 *Transition to 2017 version completed we.f 22.04.2021 valid until 12.01.2022

This certificate remains valid for the Scope of Accreditation as specified in the annexure subject to continued satisfactory compliance to the above standard & the relevant requirements of NABL. (To see the scope of accreditation of this laboratory, you may also visit NABL website www.nabl-india.org)

Name of Legal Identity: INDOMER COASTAL HYDRAULICS PRIVATE LIMITED
